Is looking for: €1,000,000

Dermicus

The skin cancer market is increasing rapidly and many patients experience long lead times for diagnosis. At the same time, the health care systems take extensive cost in terms of patient queues, unnecessary referrals to specialists and unnecessary excisions of healthy skin lesions. There are not enough experts and specialists within the field. At the same time healthcare has gone into a paradigm shift, where patients are more empowered, new digital healthcare providers arise, and digital health is becoming a natural part of the existing way of delivering healthcare.

Gnosco offers a digital diagnostic support platform for faster and more secure diagnosis of skin lesions and wounds. The CE-certified platform, Dermicus, provides a faster and more efficient medical process, improved patient experience and is specifically aimed for communication between healthcare providers. In addition, Dermicus is also a continuous E-learning platform for doctors and nurses. Total costs are decreased due to fewer excisions and less physical referrals to specialists, but most important diagnoses are set much faster than before.

iLoF

iLoF is enabling a new era of personalized, precision medicine, by providing screening and stratification tools in an affordable, fast, portable way. Currently focusing a patented platform technology on the epidemic of our century: Alzheimer's disease. iLoF delivers an inexpensive, noninvasive way of stratifying patients for Alzheimer's clinical trials. Saving 40% of the total costs for screening and 70% of the time spent screening for clinical trials of Alzheimer's, crucial to enable a treatment for the disease. By using a non-invasive test, iLoF transforms the patient experience and make trials convenient and patient-centric. Identifying gold-standard proteins and exosomes critical for the development of effective treatments, using a patented, portable, inexpensive photonics and Artificial Intelligence system. After more than 14 years and 400 major trials failed, Alzheimer's trials need help. 90% of initial enrolled patients leave trials due to invasive, inconvenient screening, causing development of potentially effective drugs to be abandoned.
